

# Medical Image Processing

---

AQIL AQTHOBIRROBBANY

A solid green horizontal bar at the bottom of the slide.

# Levels of Processing

# Levels of Processing

---

## Low-level processing

- Prosedur standar diterapkan untuk meningkatkan kualitas gambar
- Prosedur tidak memerlukan kemampuan cerdas.

## Intermediate-level processing

- Mengekstrak dan menganalisis komponen dalam gambar
- Beberapa kemampuan cerdas diperlukan.

## High-level processing

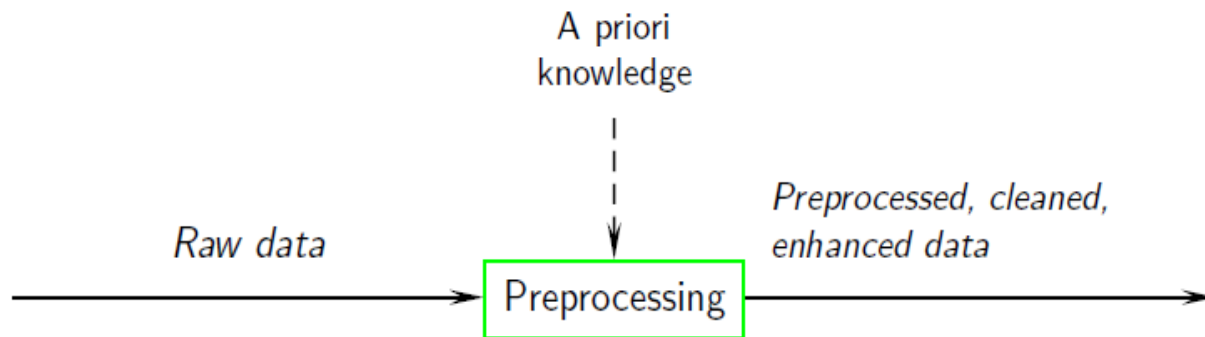

- Pengenalan dan interpretasi.
- Prosedur memerlukan kemampuan cerdas yang tinggi.

# Preprocessing

---

Examples:

Noise suppression, contrast enhancement, intensity equalization, outlier elimination, bias compensation, time/space filtering, . . .

# Preprocessing

---

- Enhancement
- Filtering
- Registration
- Calibration
- Transformation

# Enhancement

---

The objectives of image enhancement techniques is to process an image so that the result is more suitable than the original image for a specific application .

Image enhancement techniques can be divided into two broad categories:

## 1.Spatial domain methods .

- Point Processing
- Histogram Equalization
- Image Subtraction

## 2 Frequency domain methods.

- Fourier transform

# Enhancement

---

Example

# Filtering

---

The objective of filtering is to remove noise.

## Techniques

- Averaging Filter
- Median Filter
- Max/Min Filter

# Smoothing

---

The aim of image smoothing is to diminish the effects of camera noise, spurious pixel values, missing pixel values etc.

Two methods used for image smoothing.

- Neighborhood averaging and
- Edge-preserving smoothing.

# Registration

---

Medical image registration, for data of the same patient taken at different points in time such as change detection or tumor monitoring.

## Unimodal Registration

This term refers to the relative calibration of images that have been acquired with the same modality.

# Registration

---

## Multi-Modal Registration

The images to be compared are captured with different modalities.

# Transformation

---

Image transforms can be simple arithmetic operations on images or complex mathematical operations which convert images from one representation to another.

The transformation is intended to select the most prominent or relevant features.

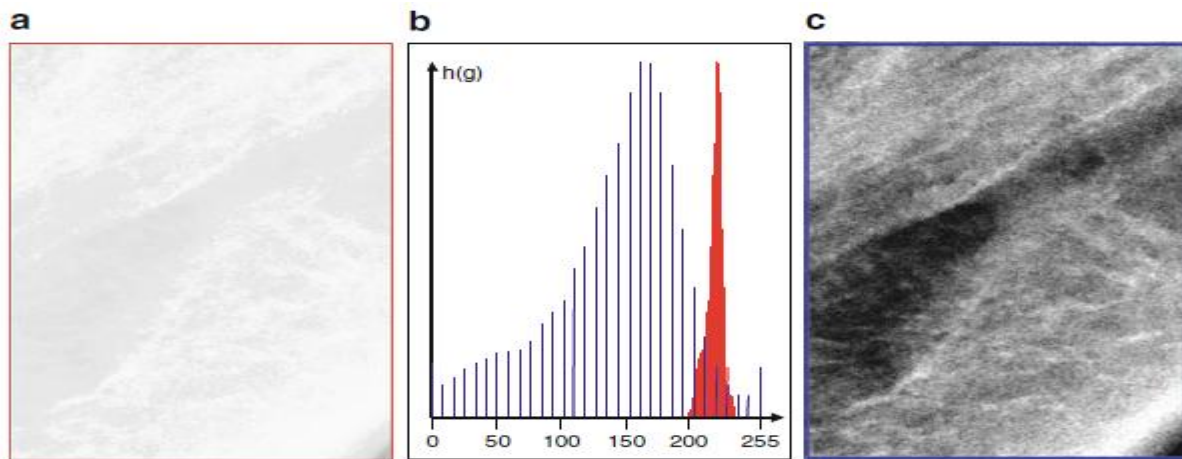

- Discrete Fourier Transform DFT
- Discrete Cosine transform DCT
- Discrete Wavelet transform DWT

---

# Example

---

---

Thank You!!
