Wind Power and Wind Turbines

Outline

- **Wind – causes?**
- **Wind Power – example**
- **Wind Turbine Design**
 - **Aerodynamics**
- **Electrical Power Converter**

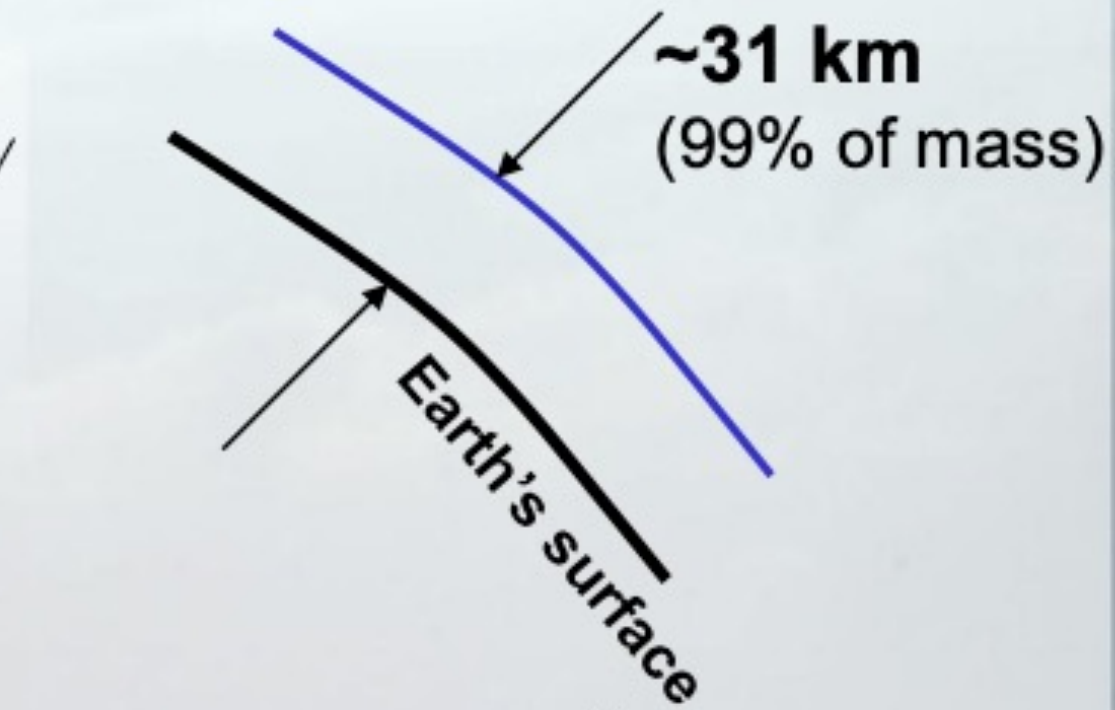

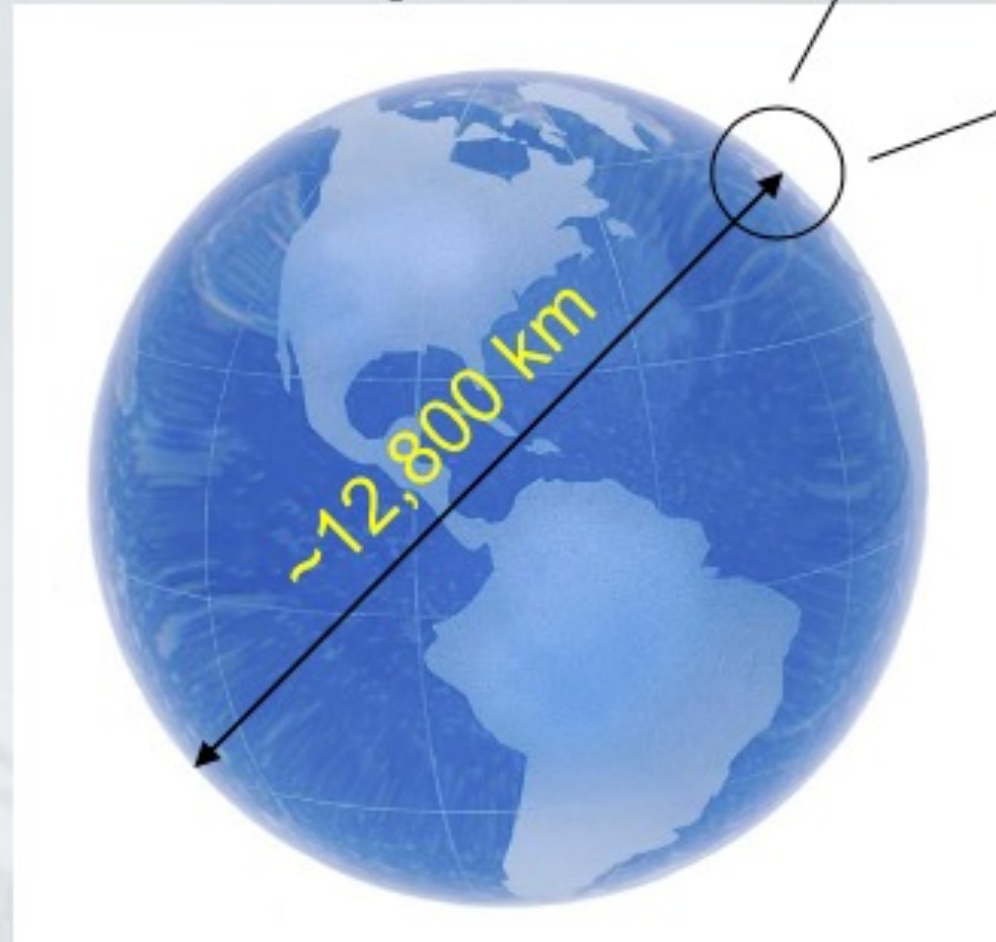

Wind – what causes it?

- **Atmospheric pressure differences**

- Where does the pressure come from?

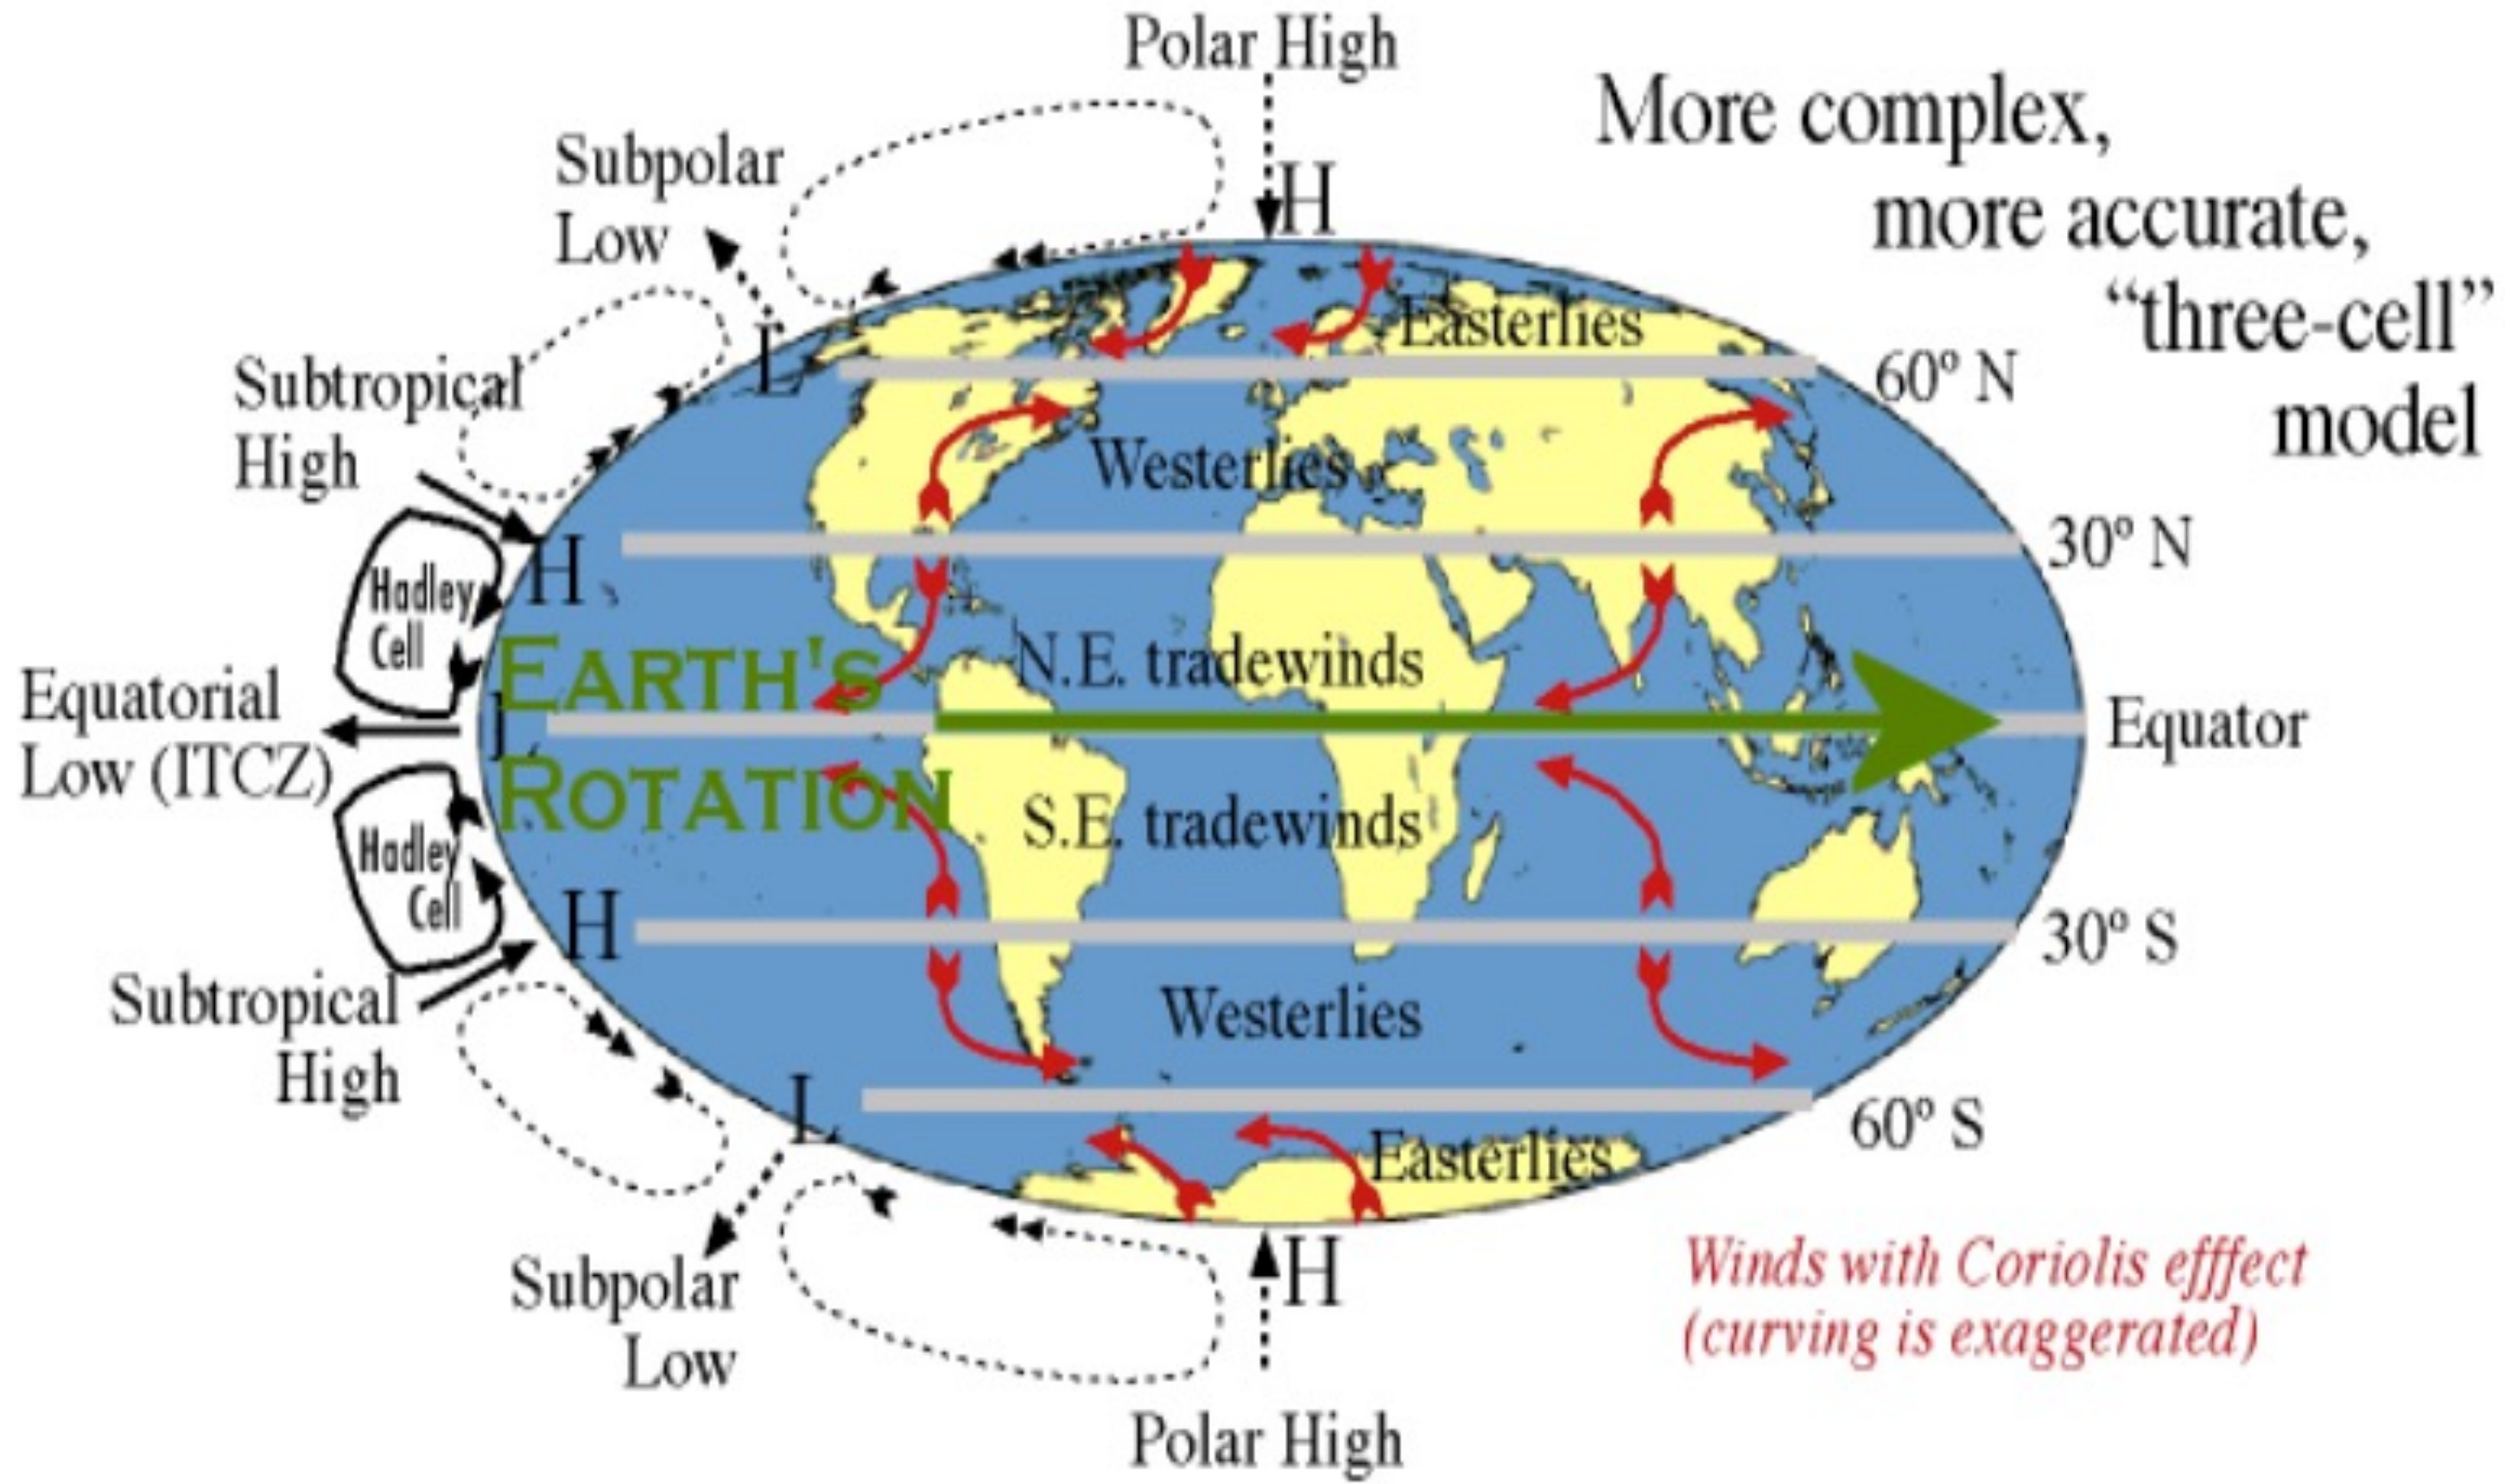

- Weight of air in atmosphere

$$\text{Pressure} = \frac{\text{Force}}{\text{Area}}$$

- **Avg. pressure at sea level**
 - 101325 Pa (Pascal)
 - 1013.25 mb (millibar)
 - 29.92 in. Hg (inches of mercury)
 - 1 atm (atmosphere)
 - 14.7 psi (pound per square inch)

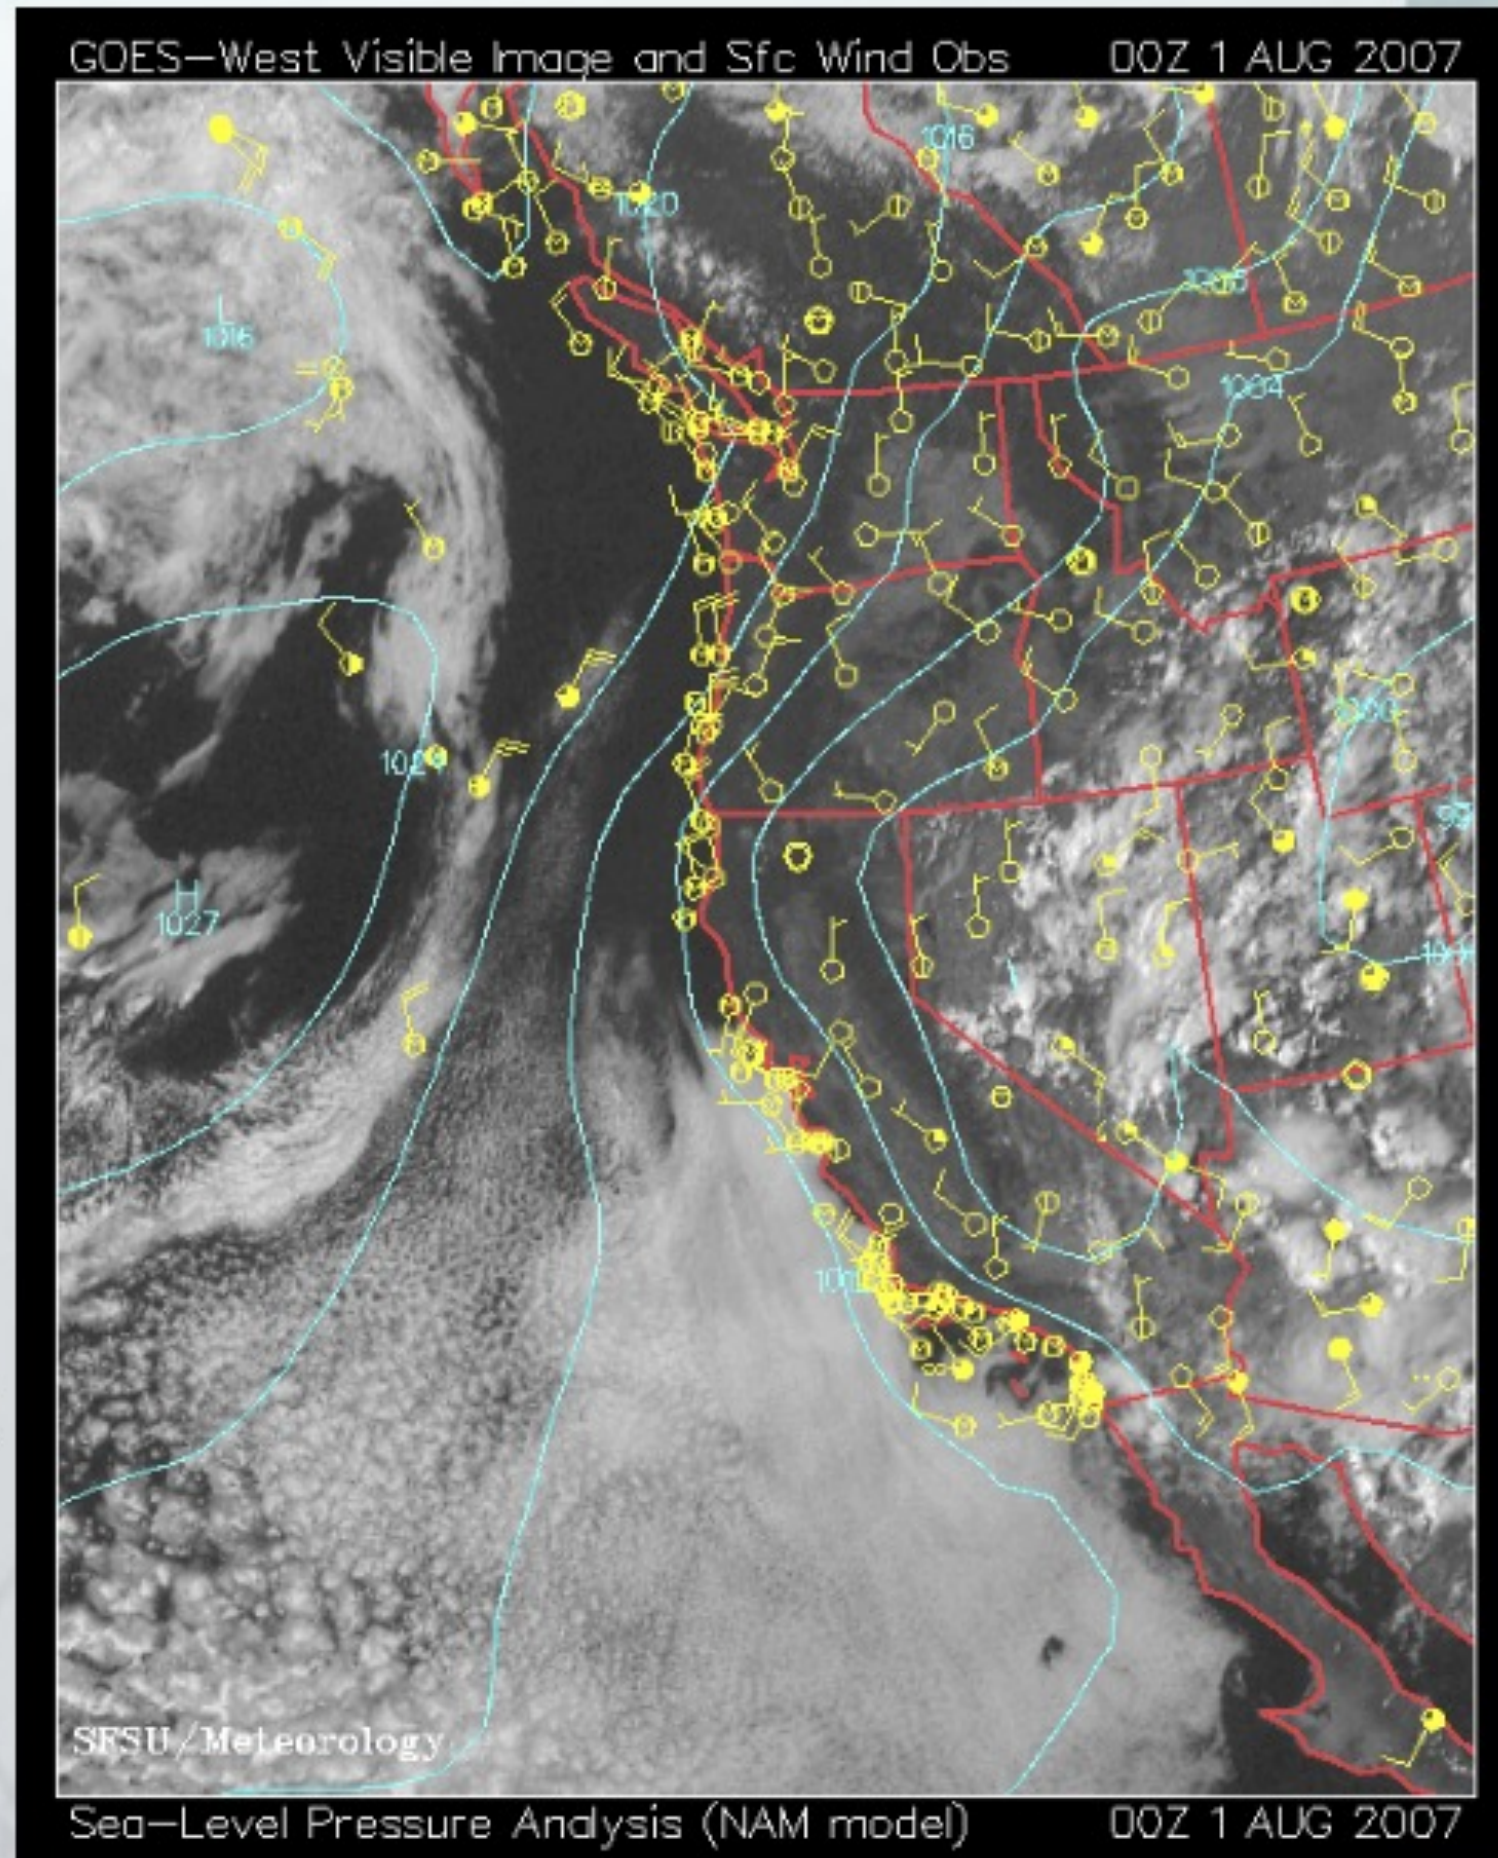

Prevailing Winds

Wind – what causes it?, cont.

• Pressure maps

- Contours of constant pressure (usually 4 mb between contours)
- Close spacing means stronger winds
- In N.H., winds circulate around a low pressure region in CCW direction

Weather Processor Symbols

WXP Symbol Legend

1 knots = 0.154 m/s
= 1.852 km/h

Wind Energy and Power

- Atmospheric pressure differences accelerate and impart kinetic energy into the air
- Wind energy conversion machines (WEC) convert wind energy into electrical or mechanical forms
- How much *power* can we extract?

$$\text{Power} = \frac{\text{K.E.}}{\text{time}} = \frac{\frac{1}{2}(\text{mass}) \times (\text{velocity})^2}{\text{time}}$$

$$\frac{\text{mass}}{\text{time}} = \text{density} \times \text{area} \times \text{velocity}$$

$$\text{Power} = \frac{1}{2}(\text{density}) \times \text{area} \times (\text{velocity})^3 = \frac{\rho A V^3}{2}$$

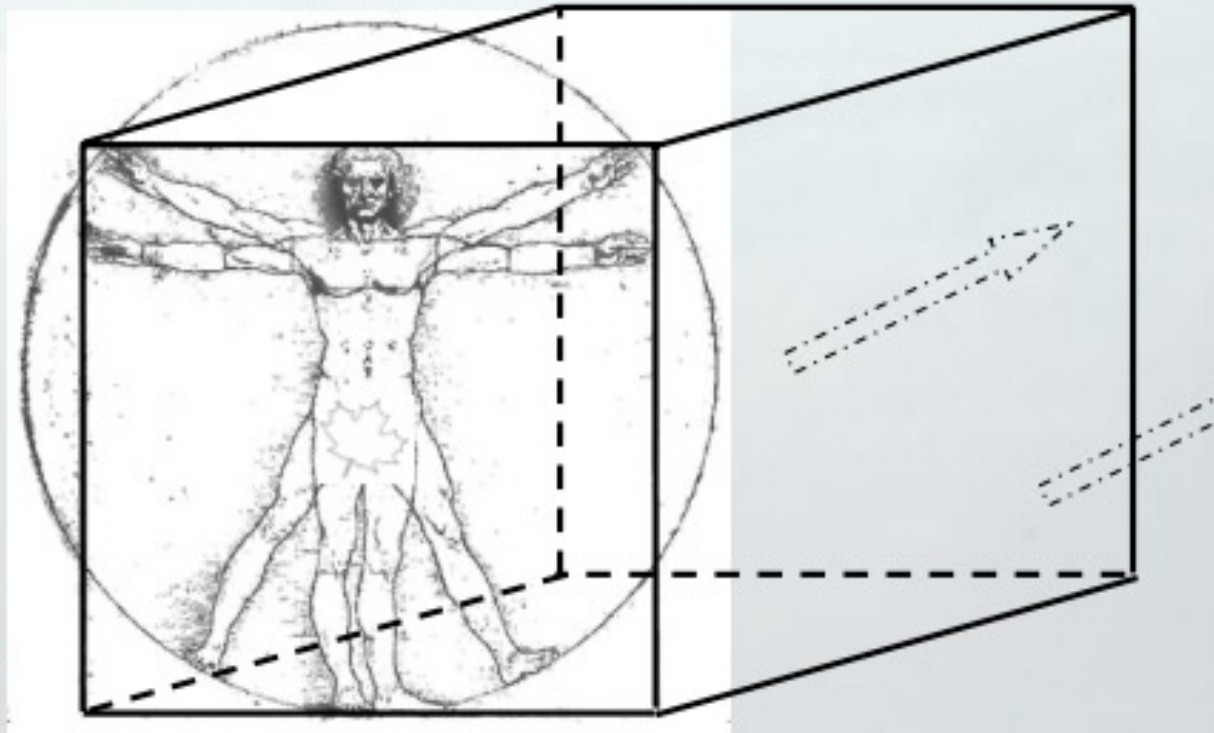

Wind Power - Example

- **Example:**

$$V = 10 \text{ m/s}$$

$$A = (2 \text{ m})^2 = 4 \text{ m}^2$$

$$\rho = 1.2 \text{ kg/m}^3$$

<http://enneagon.org/footprint/jpg/dvc01w.jpg>

<http://z.about.com/d/gonewengland/1/0/5/C/leaf5.gif>

$$\text{Power} = \frac{1}{2} (\text{density}) \times \text{area} \times (\text{velocity})^3 = \frac{\rho A V^3}{2}$$

Wind Power – Example, cont.

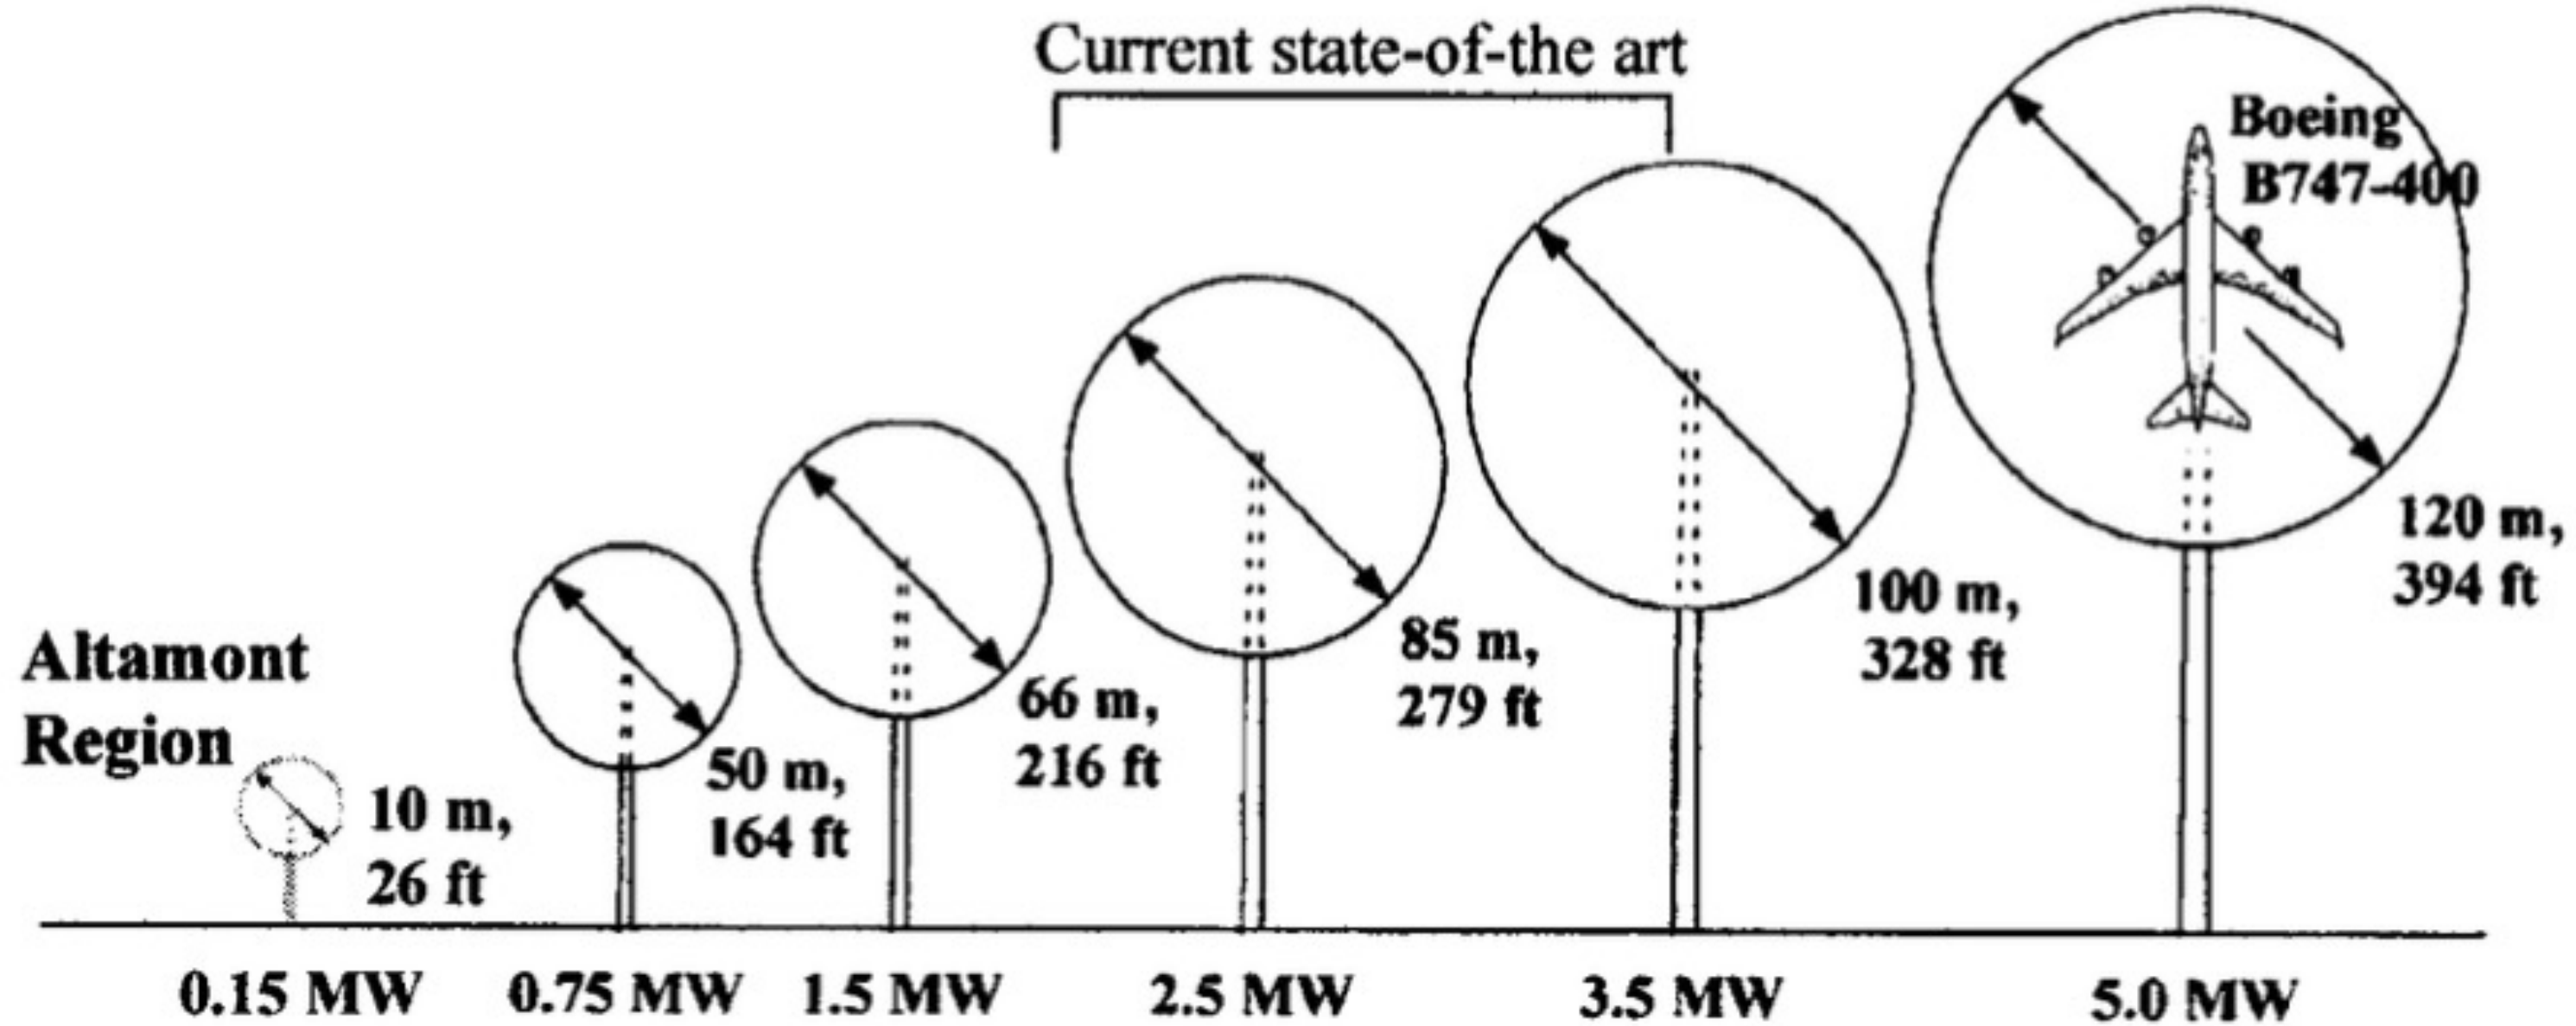

$$P = \frac{(1.2 \text{ kg/m}^3)(4 \text{ m}^2)(10 \text{ m/s})^3}{2}$$
$$= 2400 \frac{\text{kg} \cdot \text{m}^2}{\text{s}^3} = 2400 \frac{\text{kg} \cdot \text{m}}{\text{s}^2} \cdot \frac{\text{m}}{\text{s}} = 2400 \text{ N} \cdot \frac{\text{m}}{\text{s}}$$

$$P = 2400 \frac{\text{N} \cdot \text{m}}{\text{s}} = 2400 \text{ W} \quad \text{Theoretical Maximum}$$

Betz Limit: 59.3% of the theoretical is the maximum amount extractable by a wind energy conversion device (WEC)

$$P_{\text{Betz}} = 0.593(2400 \text{ W}) = 1423.2 \text{ W} \quad \text{Practical Maximum}$$

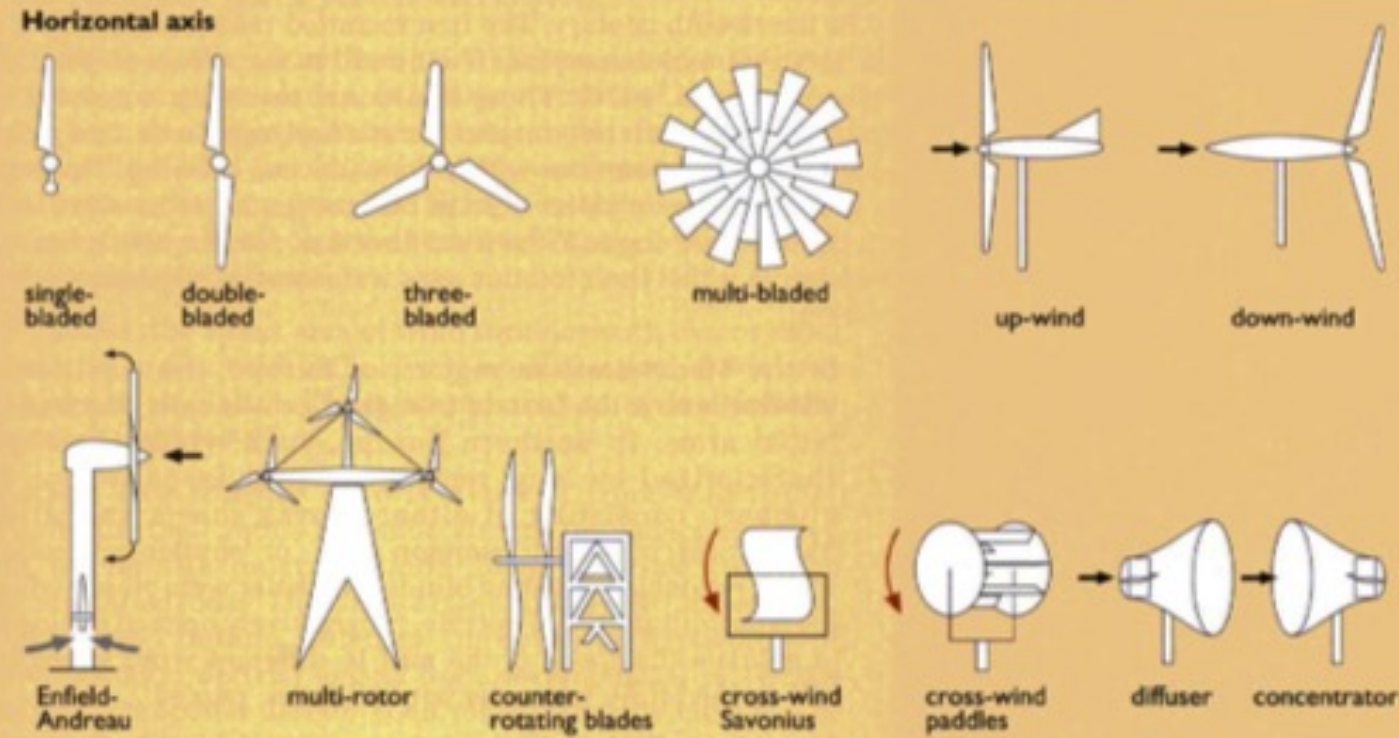

Wind Turbine Size-Power Comparison

Wind Turbine Configurations

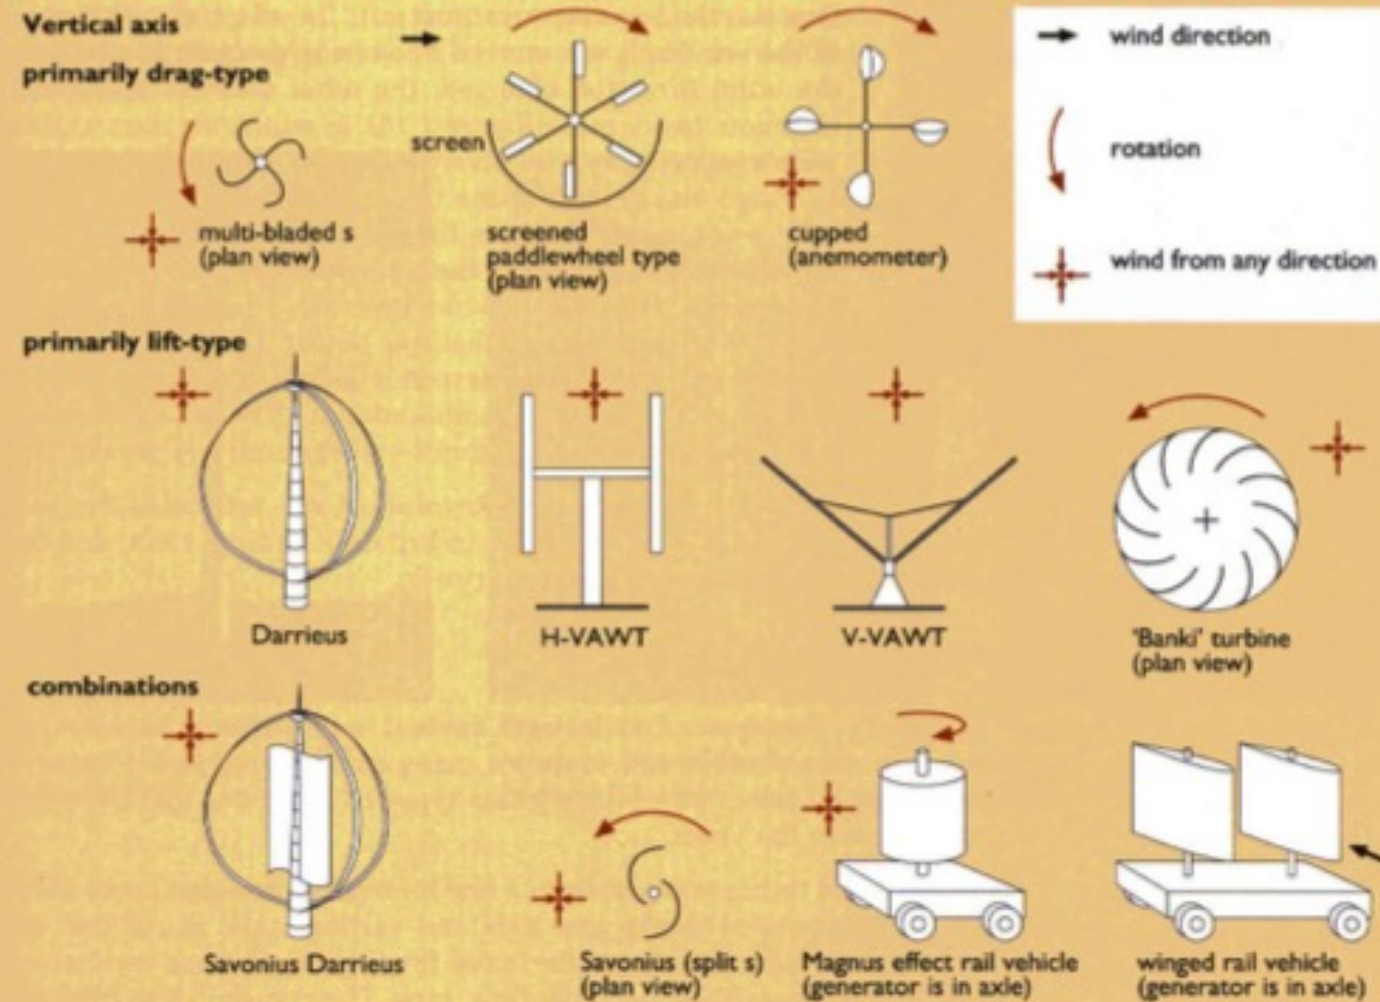

HAWT

Horizontal Axis Wind Turbin

VAWT

Vertical Axis Wind Turbin

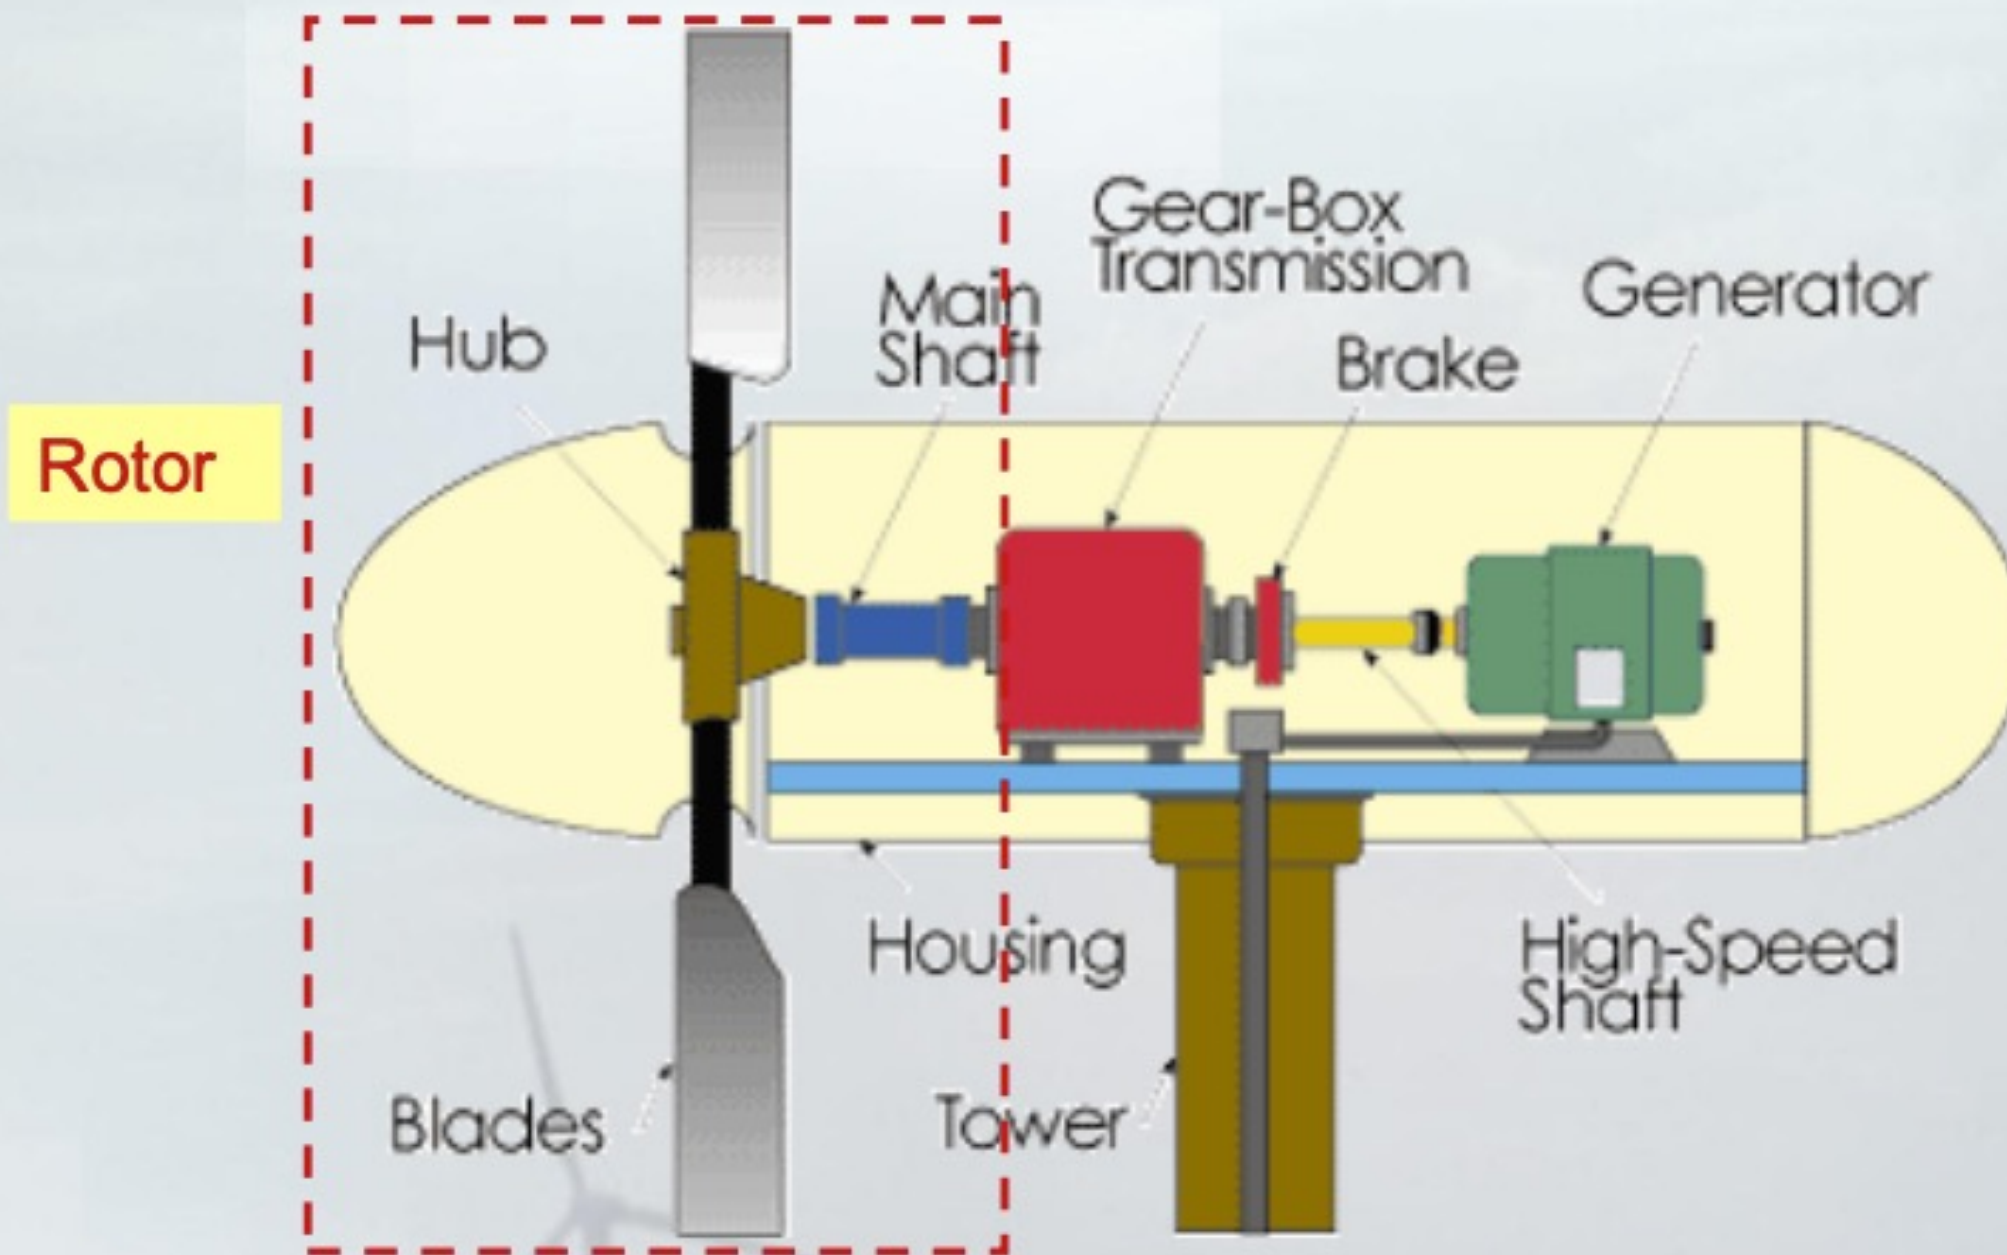

Configuration Tradeoffs

- **Factors**
 - **Efficiency**
 - Power produced per unit cost
 - **Directionality**
 - **Support configuration**
 - **Speed of rotation**
 - **Reliability**
 - **Cost**
 - **Maintainability**

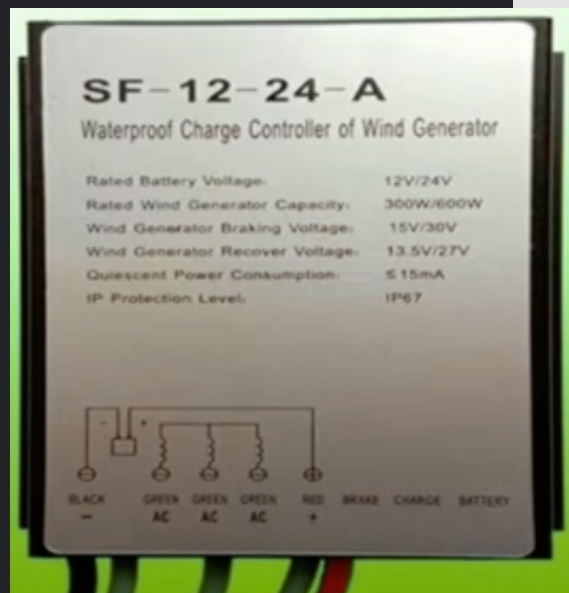

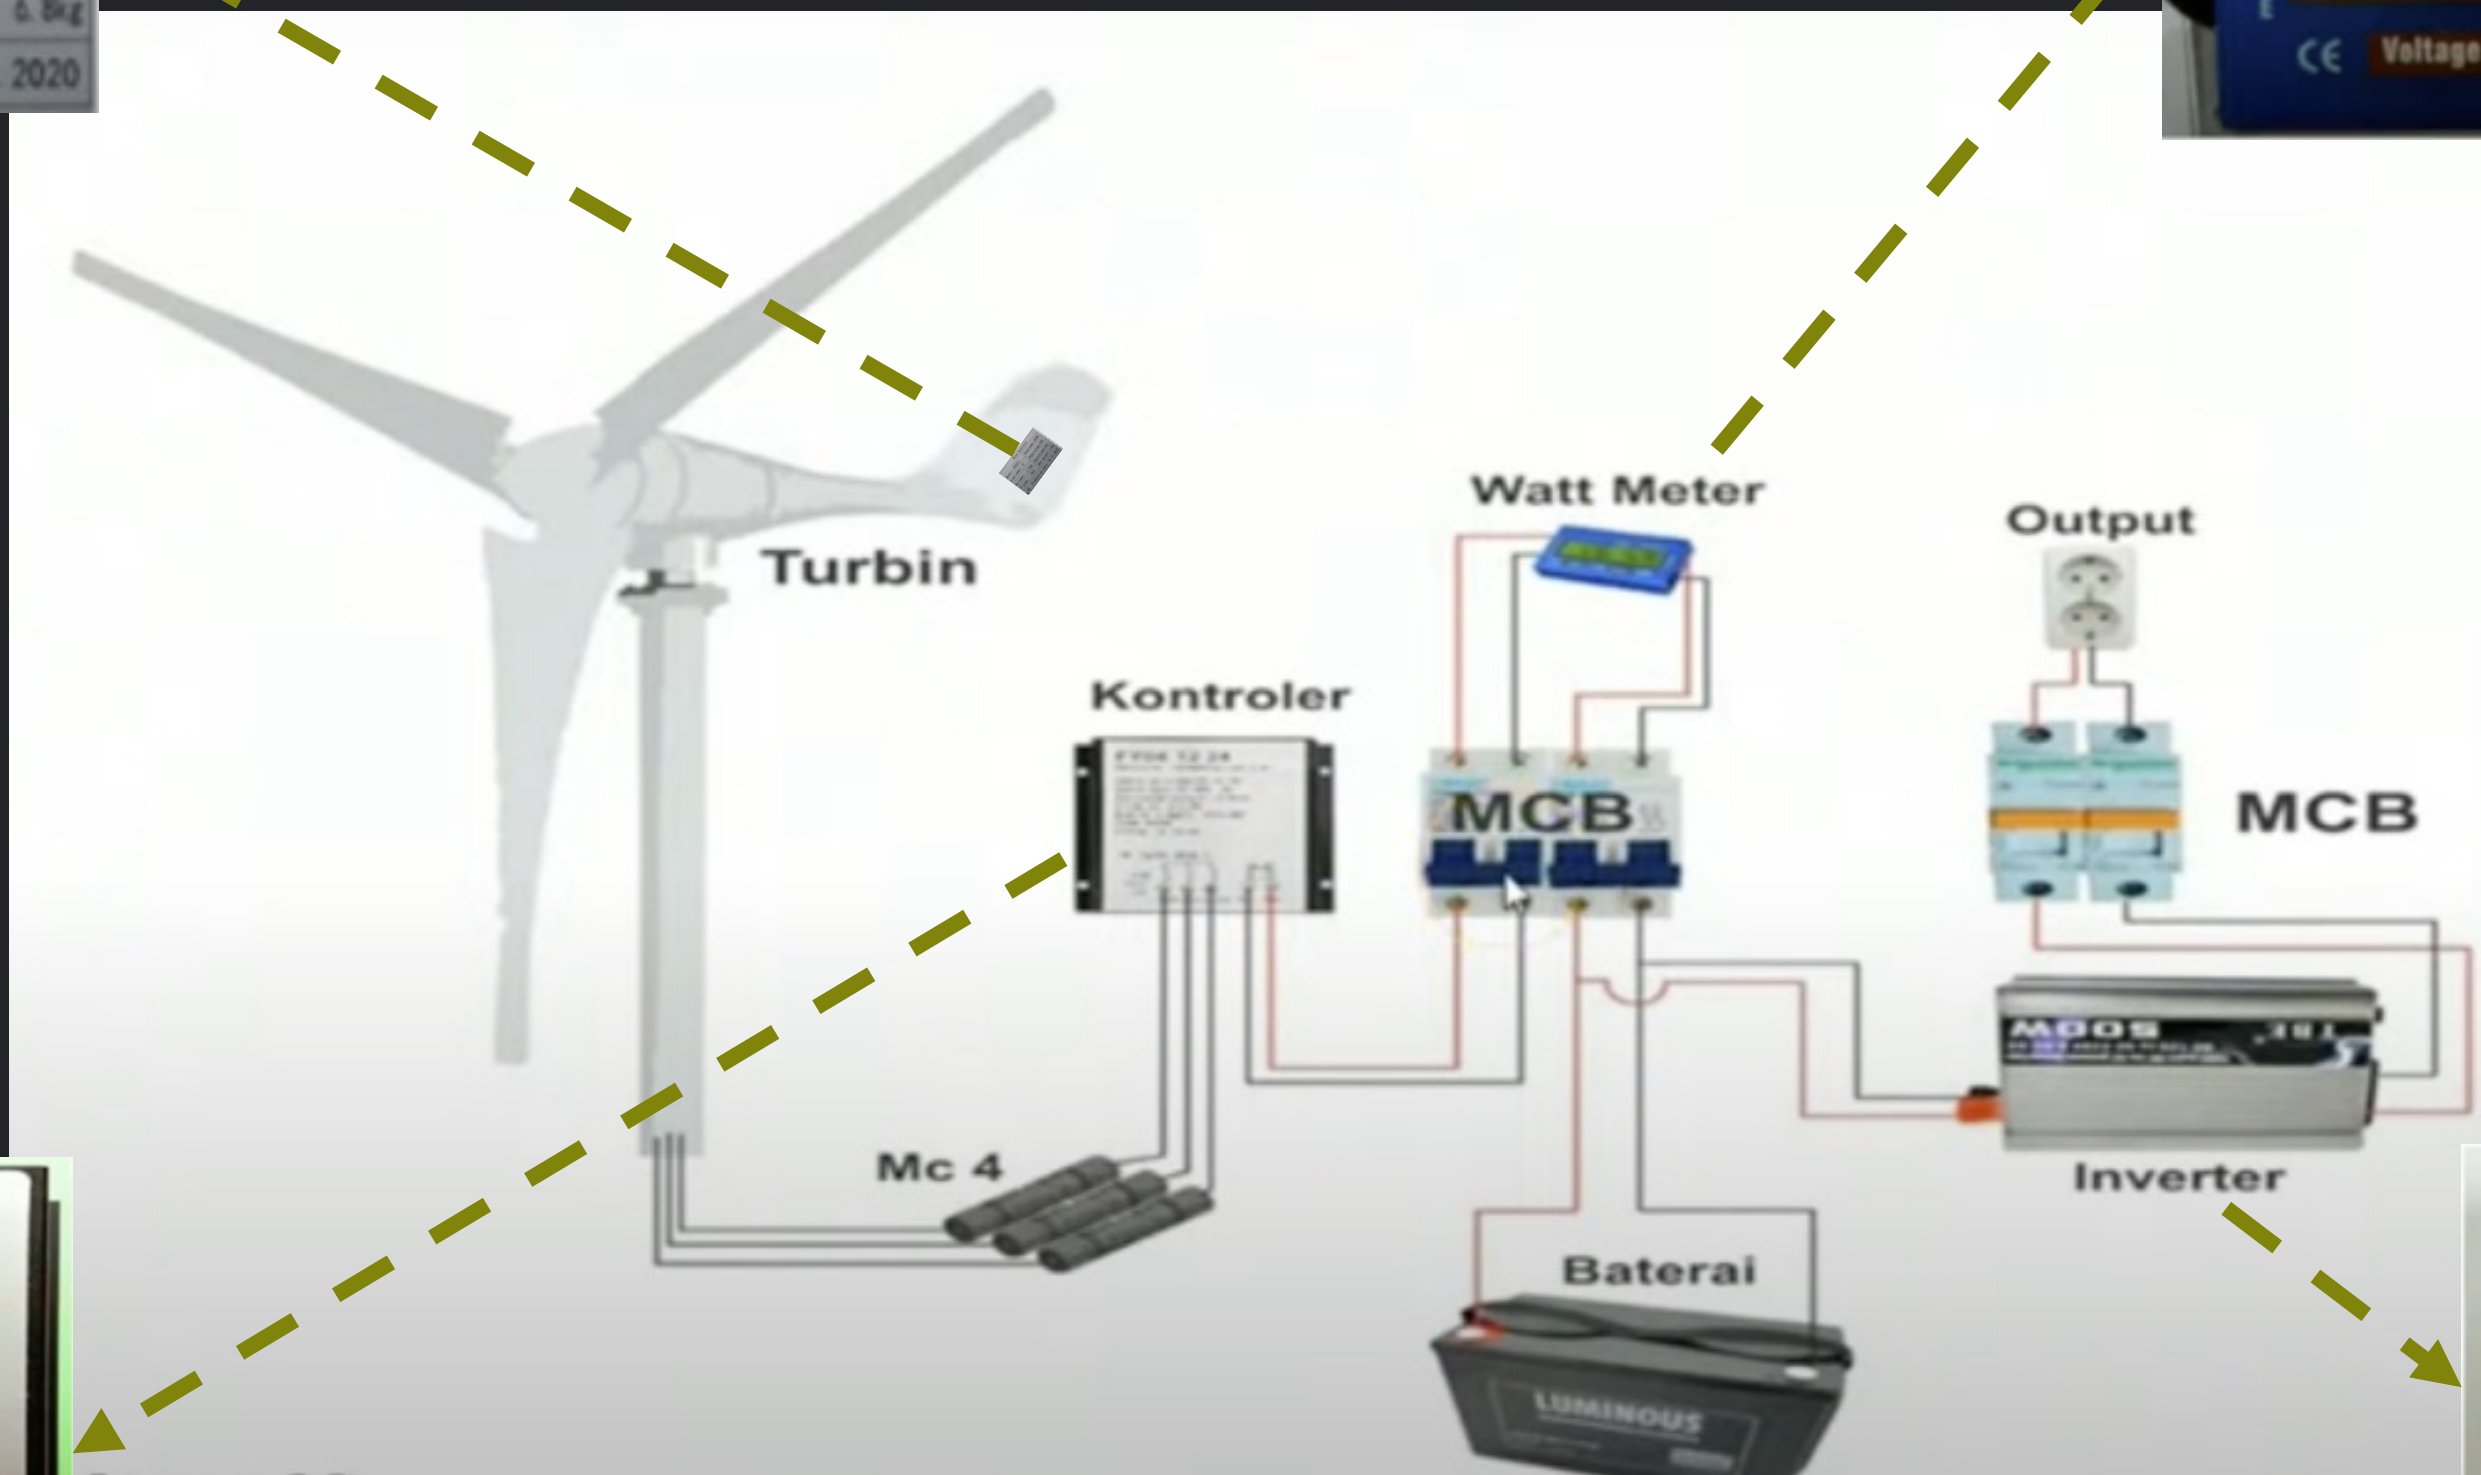

Which type is *best*, HAWT or VAWT?

Common HAWT Construction

- **Blades are connected to a hub, which is connected to a shaft**
- **Rotational speed will depend on blade geometry, number of blades, and wind speed (40 to 400 revolutions per minute typical speed range)**
- **Gear box needed to increase speed to 1200-1800 RPM for generator**

Wind Generator	
Model: 500S11	Rated power: 500W
blade number: 3	Rated voltage: 24V
Wheel diameter: 1.35m	Rated wind speed: 13m/s
IP grade: IP65	Net weight: 6.8kg
CE Production date: 25.12.2020	

Implementasi

Xianjiang, China
Wind Farm = 2,3 GW

Yorkshire Beach, England
1,2 GW

PROS

- Tidak menghasilkan limbah, polusi, dan emisi.
- Sumber energi secara cuma-cuma.
- Space ruang yang digunakan berukuran kecil.
- Dapat dipadukan dengan sumber pembangkit lain.

- Memerlukan sumber angin yang cukup
- Bersifat *intermittent*
- Kondisi alam yang tidak mudah diprediksi
- Kerusakan akibat petir
- Mengganggu kehidupan alam liar
- Biaya perawatan besar
- Membutuhkan banyak turbin
- Bising
